

Review 2451

Release Notes

Fixes and Improvements

- Resolved a cross-site scripting (XSS) vulnerability in the Viewer annotations.
- Readability issues in job collections where the approval label text was not always readable on some background colors, are now fixed and text is displayed correctly.

Public API Updates

In the last release, we introduced the Public API for integrating Enfocus Review into workflows, MIS, or Web2Print solutions. This release adds two new endpoints:

- **API info:** Added API productName and version information.
- **Single File Delete API:** Supports single file deletion.

New Features

Review Admin

If a review is uploaded by mistake, you can now delete it, ensuring end-users no longer have access.

- Accessible from the list view under All Reviews in the admin portal.
- Currently supports only single file and single collection delete, making this option not available within a collection.
