PitStop Library Container 23.03

Release notes

What's new

1. New versioning applied and added in the /version.json API.

   As of 2023, the version numbering will be YY.WW where YY stands for the current year and WW stands for the current week number. This release is 23.03, which means it has been released in the 3rd week of 2023.

   We will have a new release of the PLC every 5/6 weeks.

2. Local file system support for input and output parameters.

   See documentation 6.1.1 for more information about this feature.

   <JOBID> token can be used in output paths to make sure the filename or path are unique. Beware that existing files will be overwritten when using the same output path for different jobs.

3. Report template (branding) is now implemented as documented in the Swagger API docs.

Known issues

1. While using branding in PDF report generation, some icons are not getting added in the PDF report.

2. SQS issue when a lot of jobs are added. We have noticed that some jobs end with an internal error, so they need to be sent to the queue again to be preflighted correctly.
