

# PitStop Library Container

## 2343

Release notes

## What's new

In the 2343 version, we are happy to deliver some improvements for both the Preflight and PDF2Image services.

### 1. Preflight enhancements

- We now check the values sent to Validation for "lineArtAndTextResolution" and "gradientAndMeshResolution". Previously, a non-coherent value would not throw an error while executing the request.
- We now check the values sent to Validation for "maxItemsPerCategory" and "maxNumOccurrencesPerItem". Previously, a non-coherent value would not throw an error while executing the request.
- We fix image size parameter. Now we no longer throw error if parameter only contains width or height.

### 2. PDF2Image enhancements

- We now send a clear error message when font url is not provided
- We now display a specific response for Progress API when there is an error
- Tokenization of string for local file system support

### 3. Vulnerabilities

No vulnerability found in both preflight and PDF2image for PLC 2343.
